

Metro Private Line

Metro Private Line is ideal for customers...

- ▶ with a small number of locations
- ▶ who have locations in close proximity
- ▶ that require voice tie lines to support older PBXs

Point to Point

- Do you have multiple locations networked together?
- Is it necessary for your wide area network to be autonomous from the Internet?
- Do you need to connect multiple buildings within a campus environment?
- Is the security of your company's proprietary data mandated by industry regulations that require private line services?

Private Line Service provides network users with dedicated, digital transmission paths. It's the ideal solution for linking locations that frequently exchange data and transfer files and voice calls back and forth.

TelePacific's Metro Private Line

TelePacific's Private Line Service provides multiple location businesses with the power and capacity to connect with one another. TelePacific offers point to point service between two or more locations throughout California and Nevada, along with locations outside of TelePacific's service area, over DS1 circuits. Metro Private Line is available to TelePacific customers as a compliment to other core services.

Security

Metro Private Line is a physical circuit that connects two locations together, which means that your information does not transverse Layer 2 or 3 infrastructure like Frame Relay, ATM or MPLS. This increases the security of the transmissions.

Redundancy

Utilize your Private Line service to access voice and data services from other locations, should like-access become unavailable at a single location.

One Provider

With services throughout California and Nevada, TelePacific can service all your locations. One provider, one point of contact, one invoice.
